

***Applying statistical downscaling
to environmental management
and resource assessment***

***Rob Wilby
Climate Change Science Manager
rob.wilby@environment-agency.gov.uk***

Adaptation can involve difficult decisions...

Proposed new and extended reservoirs in England and Wales

*...and costly
investments in
major assets*

etter place

Climate model uncertainty and adaptation response...

*Downscaled precipitation
scenarios for the River Thames
under A2 emissions in the 2050s*

Talk outline

*Derwent reservoir during the 1995 UK drought.

Key questions

- *Why are we downscaling?*
- *How should we apply downscaling within a probabilistic framework?*
- *What are the outstanding scientific challenges for the downscaling community?*

***Why are we downscaling?
Appraisal of adaptation options
for the River Kennet***

creating a better place

Long-term nutrient enrichment of the River Thames, 1930-2000

‘Luxuriant’ macrophyte growth

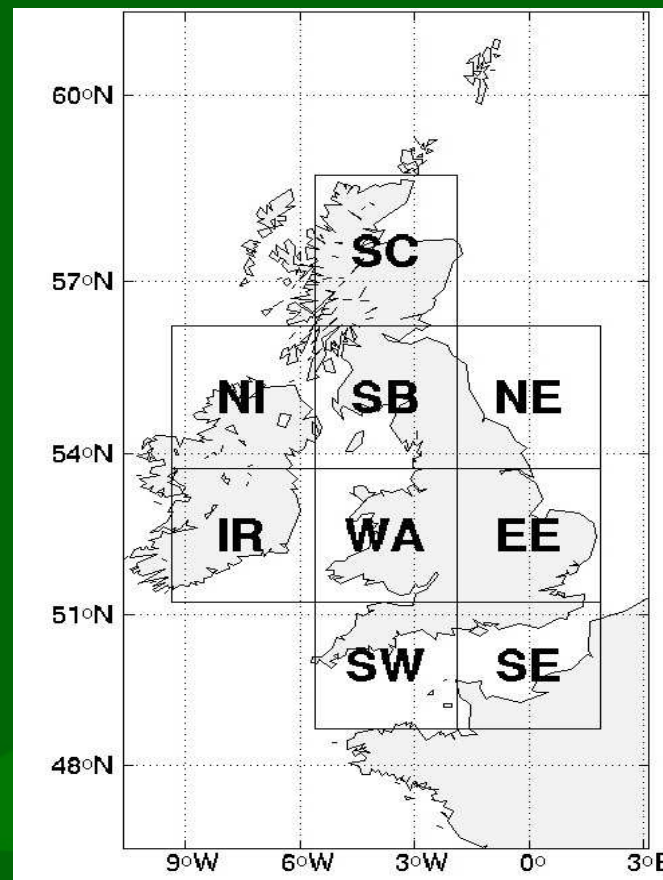

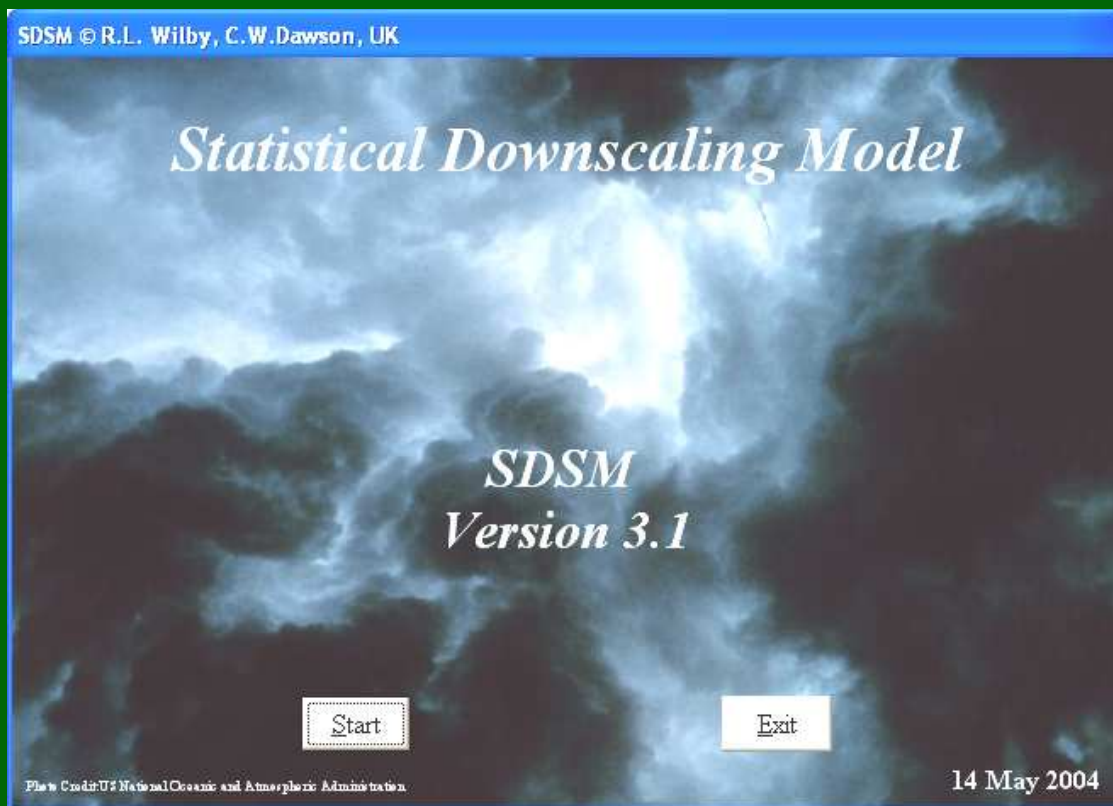

Appraisal of adaptation options

Five scenarios

- *Baseline conditions under HadCM3 A2 emissions*
- *Fertiliser use reduced by 50%*
- *Deposition of atmospheric pollutants reduced by 50%*
- *Water meadow creation (4 x surface area of river)*
- *Combined approach with 25% reduction in fertiliser and deposition, water meadow creation (2 x surface area)*

Statistical DownScaling Model (SDSM) and predictor variable archive

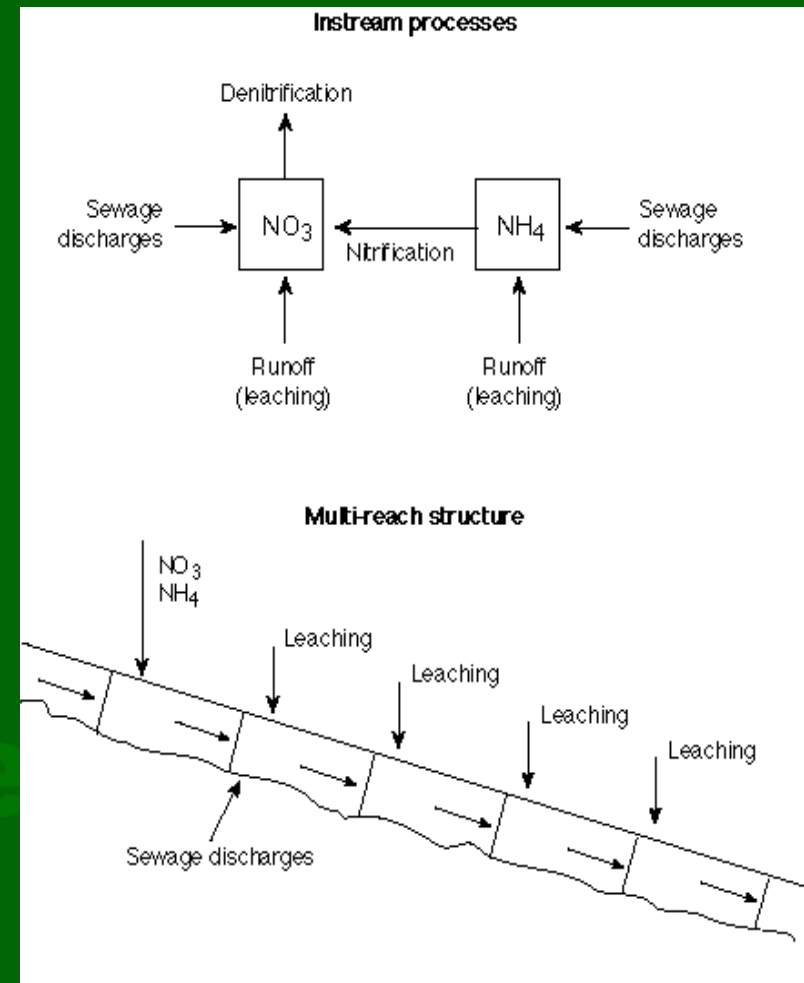

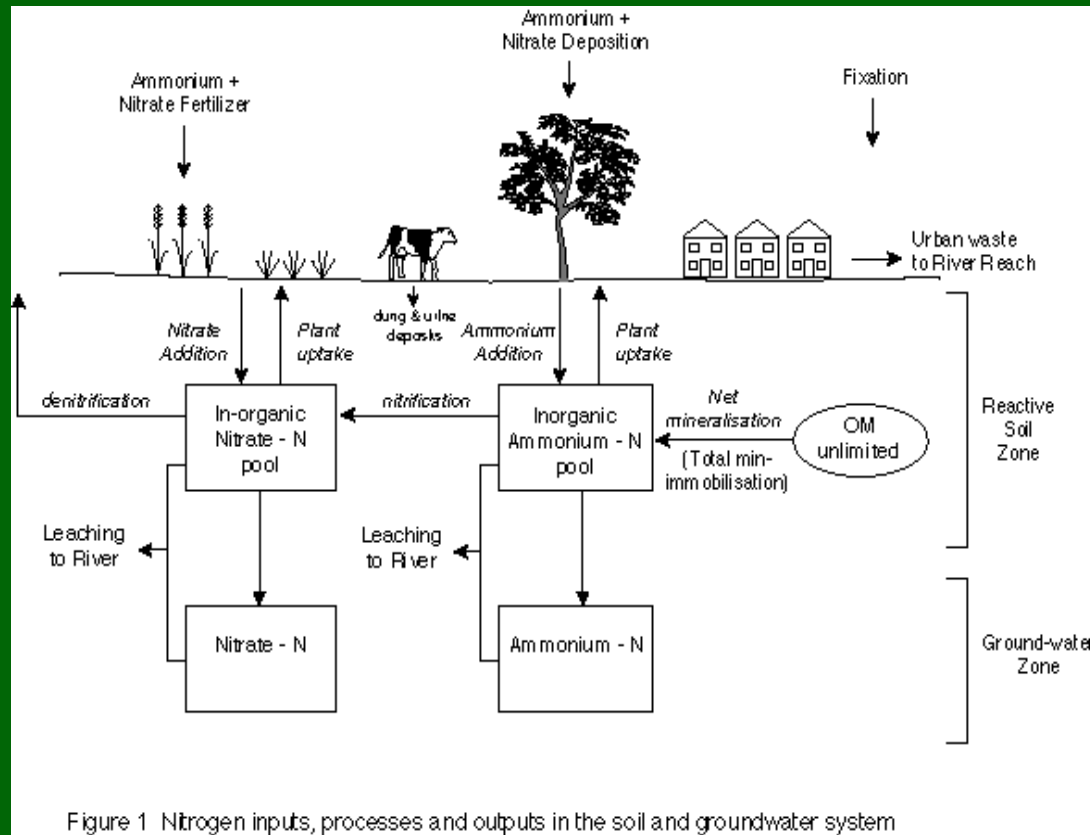

<http://www.sdsm.org.uk/>

CATCHMOD daily river flow changes under A2 emissions

Daily precipitation and PE downscaled for the River Kennet using three GCMs for the 2080s

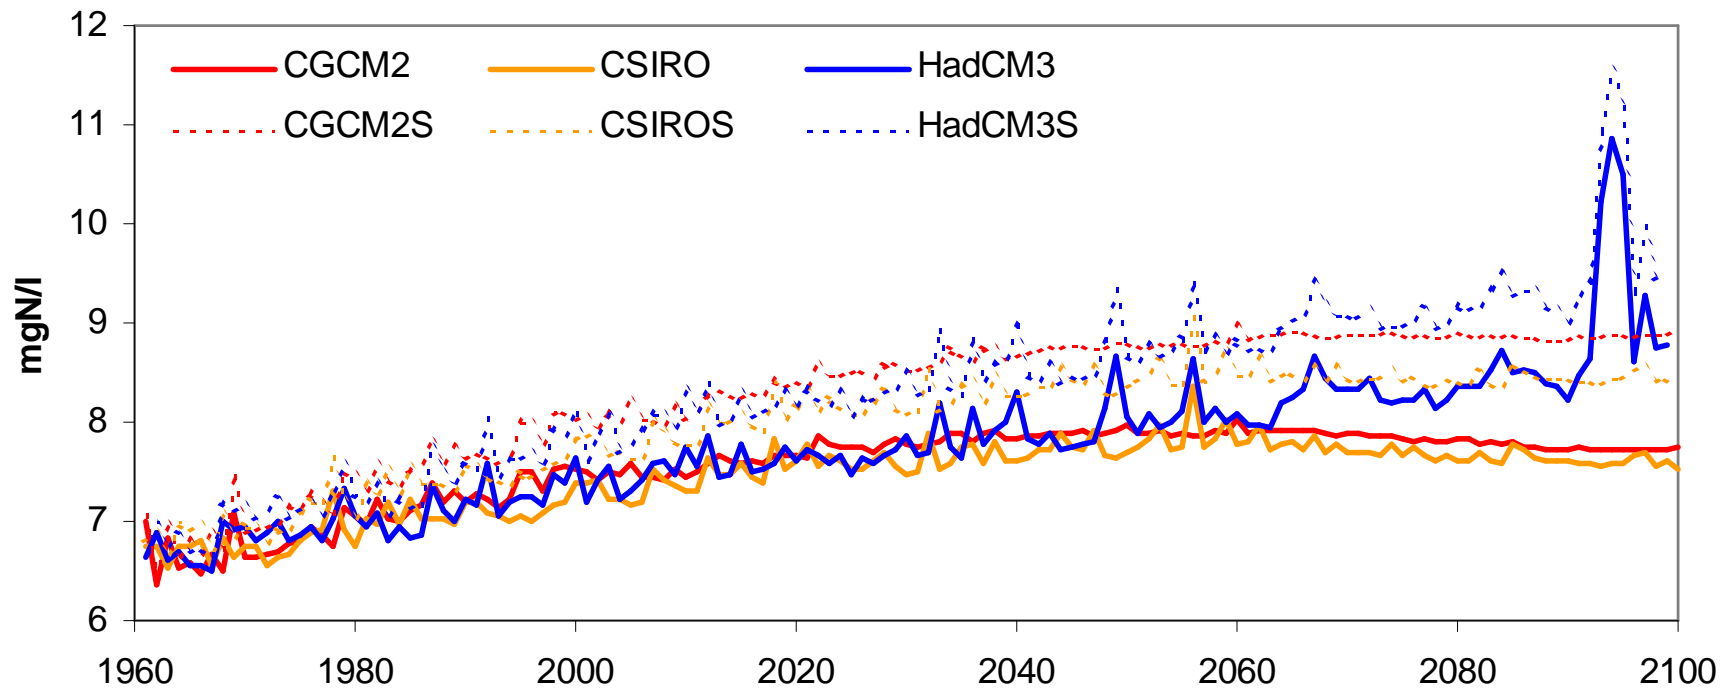

INCA-N model of soil and instream nutrient concentrations

INCA-N simulation of Nitrate-N under A2 emissions: headwater

Nitrate as Nitrogen, A2 emissions

Concentrations exceeded 5% of the time

Simulation of adaptation outcomes under HadCM3 A2 emissions

Nitrate as nitrogen, A2 emissions

Concentrations exceeded 5% of the time

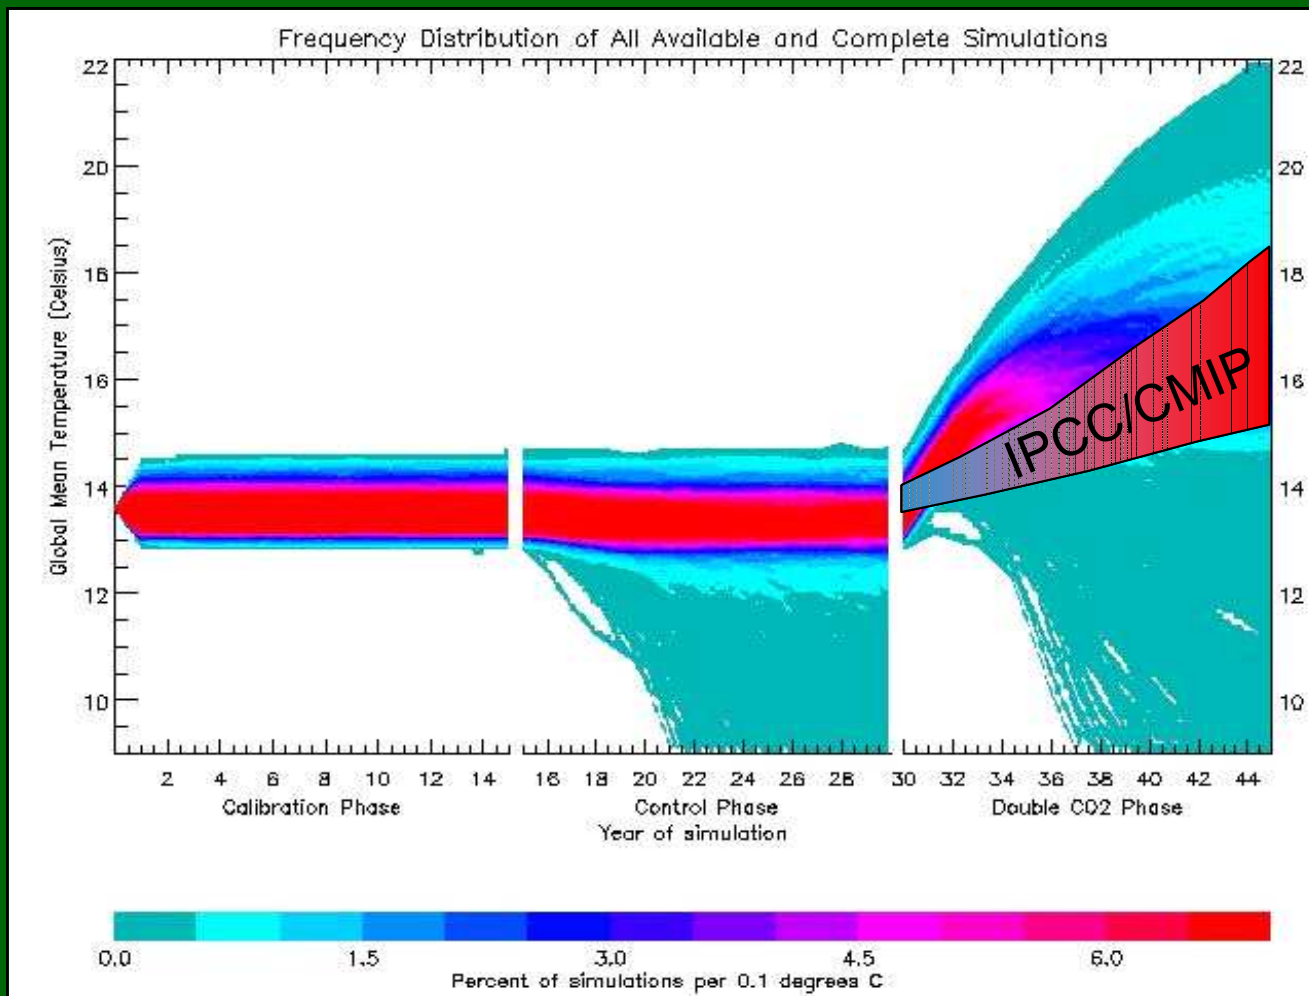

Why downscale?

- *Link scenarios to space-time **scale** of impact model (INCA-N) to explore complex **transient** response at sub-grid scales*
- *Assess the impact of future **extreme** (drought) events*
- *Generate **exotic** predictands (such as PET) that are not directly available from GCMs*
- *Explore **uncertainty** in future (summer) climate due to GCM or the outcomes of mitigation options*
- *Rapid assessment of **adaptation** measures that will be sustainable under climate change*

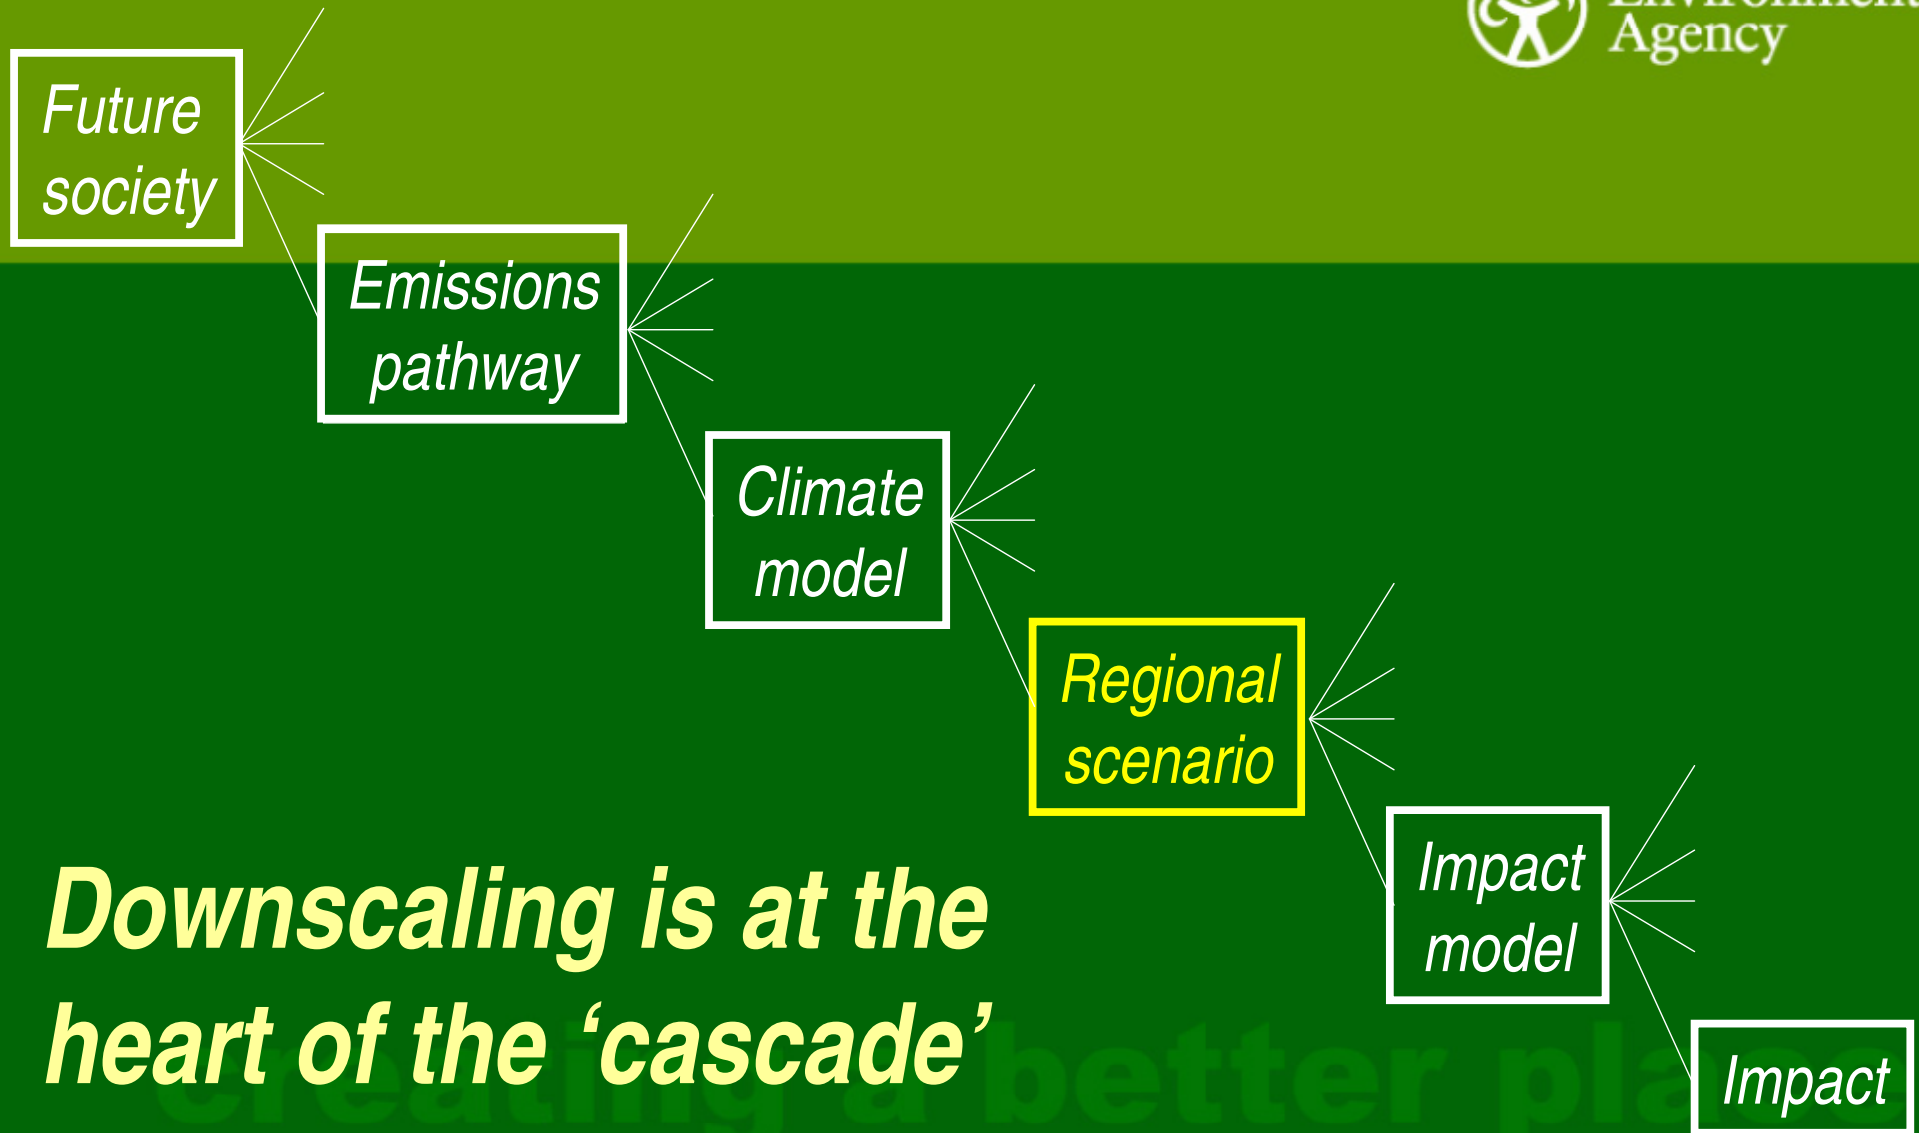

***How to downscale within a
probabilistic framework?
Assessing uncertainties in low flows
for the River Thames***

creating a better place

Impacts assessment using mega-model ensembles

Frequency distribution of global mean temperature response to doubled CO₂ produced by CP.net, compared with IPCC (2001) range.

Downscaling is at the heart of the 'cascade' of uncertainty

Uncertainties due to GCM/ downscaling pair

An Impacts Relevant Climate Prediction Index

Model	Summer		Winter	
	<i>Bias (%)</i>	<i>Weight</i>	<i>Bias (%)</i>	<i>Weight</i>
CGCM2	52.1	0.138	42.2	0.074
CSIRO	14.3	0.503	6.0	0.522
ECHAM4	49.6	0.145	16.1	0.194
HadCM3	33.6	0.214	14.9	0.210
NCEP	7.6	n/a	4.8	n/a

This IR-CPI is based on the skill of the GCM/downscaling pair for effective rainfall in the Thames basin

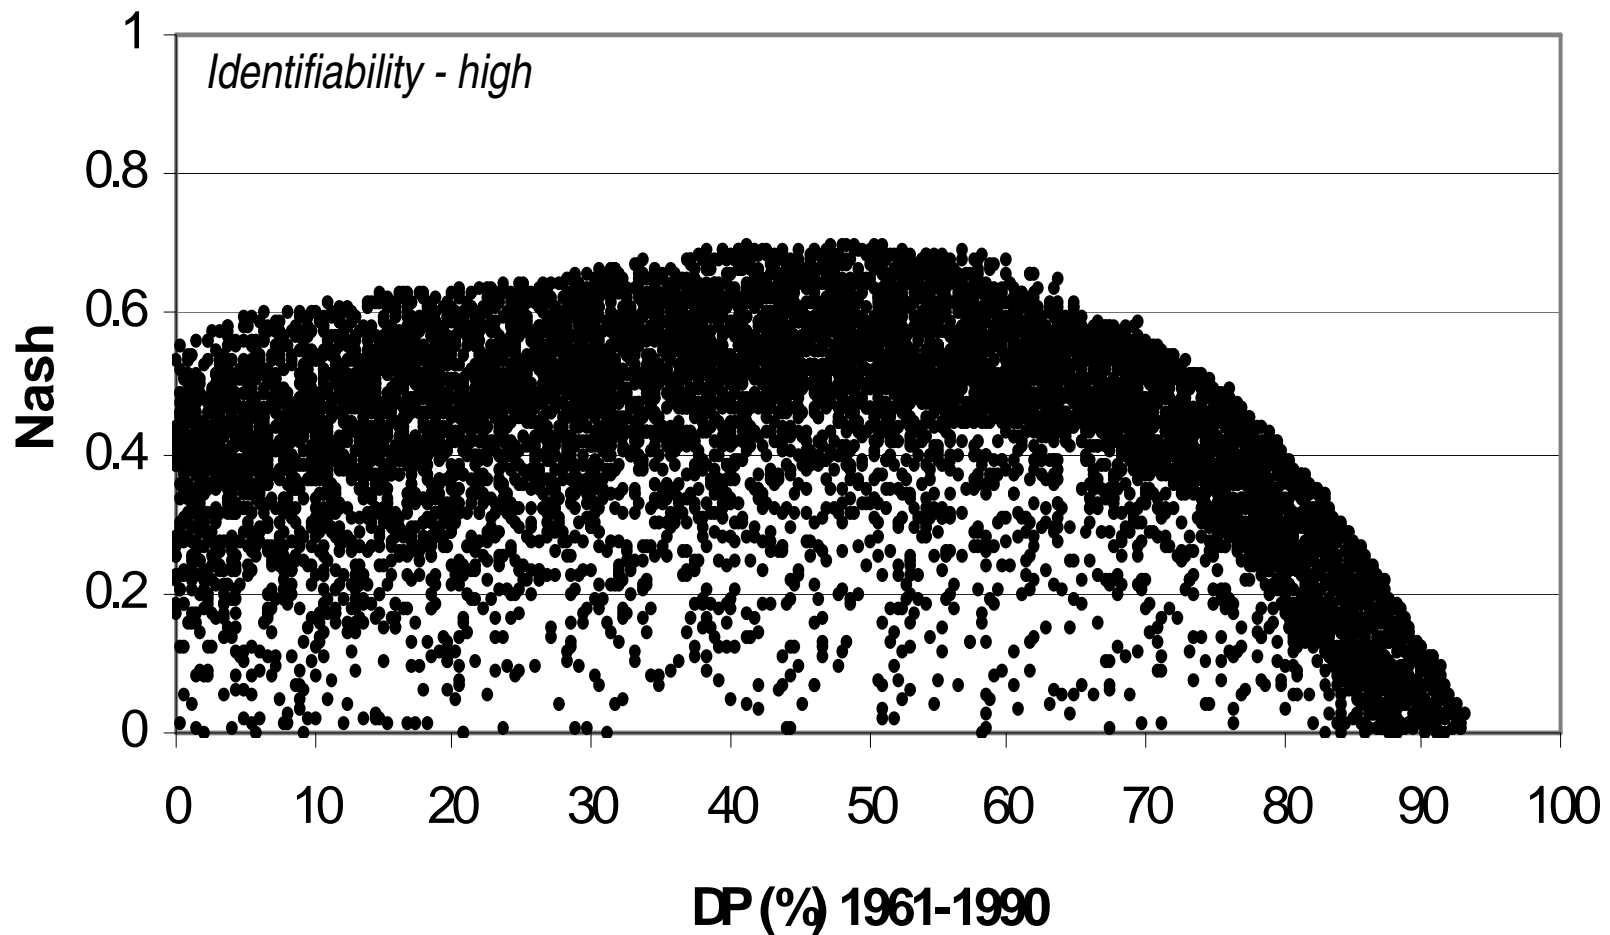

... better place

Uncertainty due to low flow model structure

Derived from observed daily rainfall and PE

Uncertainty due to water resource model parameters

An experimental framework for assessing uncertainties

- *4x GCMs, 2x emissions, 2x downscaling methods, 2x low flows models, 100x parameter sets*
- *Weight GCMs by modified Climate Prediction Index*
- *Weight low flow model structures by r_{adj} statistic*
- *Weight low flow model parameters by N-S score*
- *Emissions and downscaling method unweighted*
- *Monte Carlo simulation (2000+ runs)*
- *Evaluate using (Q95) low-flow index for River Thames*

Uncertainties due to emission scenario

Uncertainties due to GCM

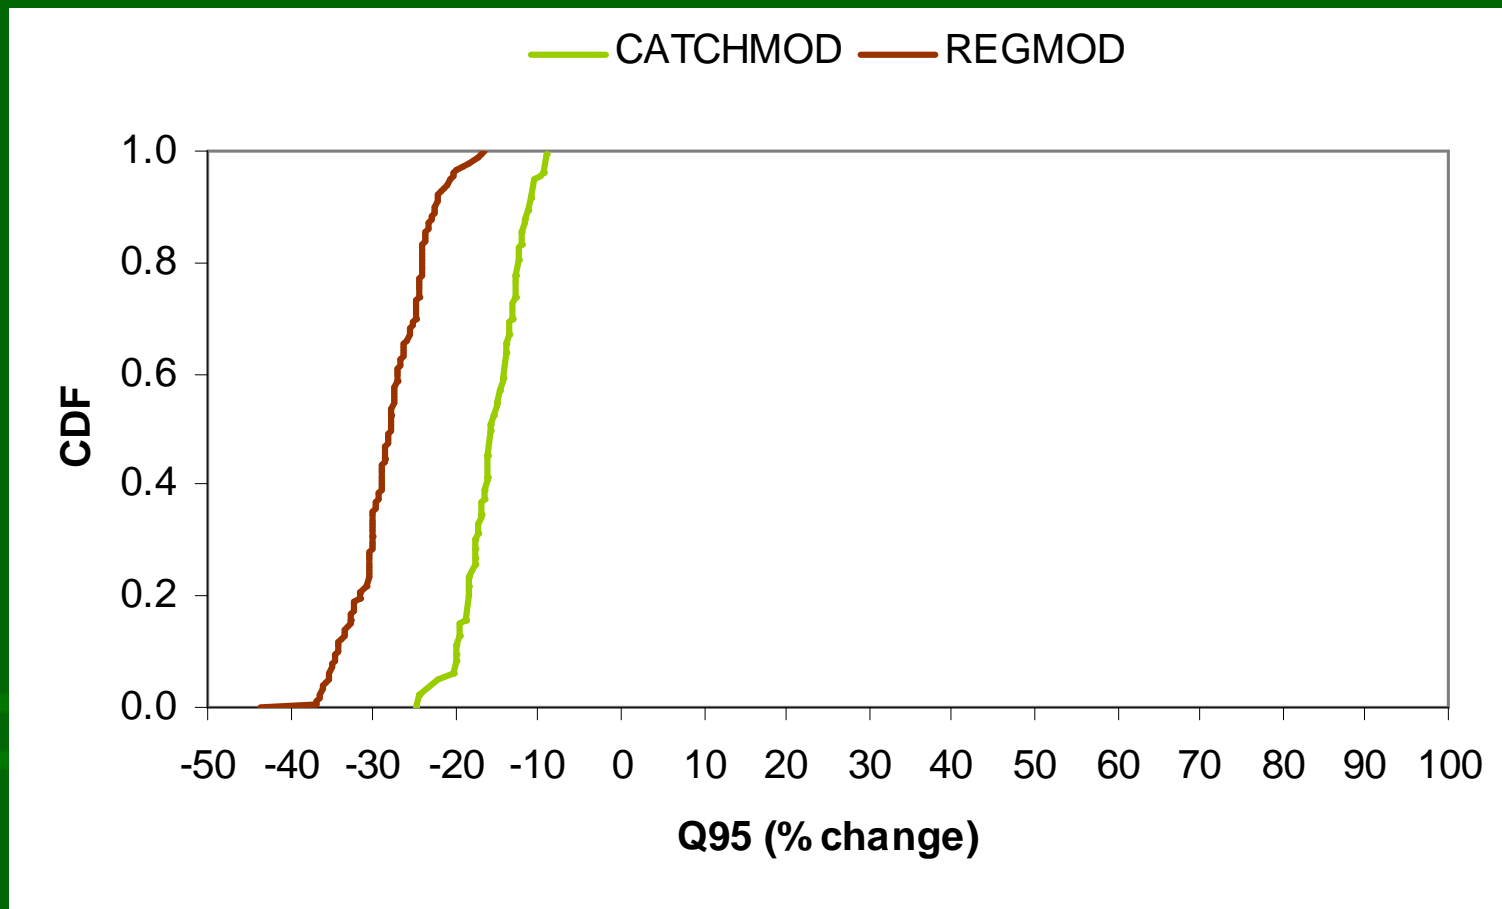

Uncertainties due to downscaling method

Uncertainties due to low flow model structure

Uncertainties due to low flow model parameters (HadCM3, A2)

Combining all sources of uncertainty

Downscaling is a significant component of uncertainty

Uncertainty component	Likelihood	
	Min	Max
Emissions	82	83
GCM	47	100
Downscaling	66	100
Hydrological model	72	92
All weighted/ unweighted	76	82

Conditional probabilities of lower summer river flows in the Thames by the 2080s

***What are the outstanding
scientific challenges?***

***A proposed research agenda for the
downscaling community***

creating a better place

Please can we have:

- *NO MORE COMPARISON STUDIES!!!*
- *A dossier of best practise and case studies where downscaling has actually shaped decision-making*
- *More physical insight in our downscaling (e.g., local controls, land-surface feedbacks, extreme events)*
- *Incorporation of downscaling in risk-based modelling frameworks to inform adaptations responses*
- *A downscaling community 'Wizard'*

Thanks!!!

*Warmer winters have helped the ring-necked parakeet
to establish viable populations in southern England*

Creating a better place
